

EMIF Deliverable 1.4: Cohort of cognitively normal subjects with AD biomarkers baseline data

Executive summary

Executive Summary

We have included in total 286 out of 300 subjects. At Manchester inclusion will continue. We have analysed the first data and presented them at several conferences. We have submitted one paper on MEG analysis and started preparation for papers on white matter lesions, cortical thickness, cognitive function, and amyloid binding.

Detailed AD phenotyping performed in 286 cognitively normal subjects, including 196 monozygotic twins.
