

EMIF Deliverable 6.1: Construction of an analytical framework

Executive summary

Executive Summary

The construction of an analytical framework for the work-package was based on the following actions:

- Assembly of 20,000 obese study participants from a consortium of quantitative metabolic trait studies.
- Selection of quantitative metabolic characteristics for investigation in selected studies.
- Construction of a metadata directory to describe data from each participating study.
- Development of a data harmonisation strategy across studies.

In this deliverable, we report a description of how the aforementioned actions were undertaken and of their results.
