

EMIF Deliverable 1.5: Cohort of cognitively normal subjects with 2-year follow-up data

Executive summary

Executive Summary

At baseline we have included in total 285 cognitively normal individuals. We performed a follow-up study after 2 years including clinical and neuropsychological testing in 229 individuals and repeated eye examination, physical examination blood and CSF collection in a subset. Preliminary analyses showed that cognition declined slightly at follow-up, as expected.
