Executive Summary

The EMIF-Platform is based on a federation of data sources, rather than a centralized database containing all data. Therefore, tools need to be developed that run locally at the data custodian site to perform anonymization and create study-specific analytical datasets which comply to local governance rules.

This deliverable describes the final version of the software tool Jerboa that has been built for this purpose. It briefly describes how the software will be shared as open-source software and describes in detail the functionality of the tool.
