

EMIF Deliverable 12.1: Data extraction software v1

Executive summary

Executive Summary

The EMIF-Platform is based on a federation of data sources, rather than a centralized database containing all data from the participating sources. The consequence of this decision is that tools need to be developed for each data custodians to perform anonymisation and study specific data extraction.

This deliverable introduces the first version of a software tool, called Jerboa Reloaded, which is developed for this challenging task. It is used in a distributed network design, i.e. each data custodian runs the software locally using a common script and input files. A module used for primary data extraction on population level is presented to enrich the fingerprinting browser that contains data obtained from questionnaires.
