

# EMIF Deliverable 12.2: Data extraction software v2

## Executive summary

---

### Executive Summary

The EMIF-Platform is based on a federation of data sources, rather than a centralized database containing all data. Therefore tools need to be developed that run locally at the data custodian site to perform anonymisation and study-specific data extraction.

This deliverable describes the second version of the software tool Jerboa Reloaded that has been built for this purpose. It describes newly developed modules for incidence, prevalence, code counting, BMI measurements, a module to directly communicate with the OMOP CMD by SQL, and a module to perform sensitivity analyses on extraction algorithms.
