

EMIF Deliverable 6.8: Investigation of the causal nature of associations between obesity and selected obesity-related complications

Executive summary

Executive Summary

The MRC Epidemiology Unit's research team investigated the causal relevance of associations between obesity and selected obesity-related complications (i.e. Alzheimer's disease and endometrial cancer). The approach of choice was Mendelian Randomisation. The effort, led by Dr Scott, resulted in two manuscripts which were approved for publication by the EMIF-Metabolic Executive Committee in September 2014.
