

EMIF Deliverable 8.2: Study report or manuscript on the calibration of the Framingham Risk score in European NAFLD patients

Executive summary

Executive Summary

An analysis of the impact of NAFLD on prediction risk scores for cardiovascular disease showed that adding NAFLD to risk scores (US Framingham risk score, the American Heart Association CVD score and the European HEARTSCORE) did not improve the prediction of incident cardiovascular events, using data recorded in primary care EMR data from two European countries.
