Executive Summary

The EMIF-Platform will be developed using a rapid prototyping approach. That is, a quick and continuous loop of requirements gathering, prototyping, evaluation, collecting user feedback, developing new prototypes and thus refining the user requirements. The first version of Platform requirements were generated in D9.1.

This deliverable contains updated and new low-level requirements in the form of use cases, as well as the approach for the ongoing evaluation of the EMIF-Platform. A loop of evaluation, requirements gathering and development will be followed.

User groups representing the different types of prospective users will be consulted at the appropriate times, when evaluating a use case that would impact them. A variety of methods can be used in combination, such as test scripts, demonstrations, free exploration, and heuristic evaluation, followed by questionnaires to collect feedback. Interfaces and strong communication between WP9 and each of the use case leads is of great importance in this process. Evaluation and hence review of requirements will be triggered by each use case.

The results of the first evaluation are summarised with recommendations for next steps.
